Genome-wide complex trait analysis (GCTA) Genome-based restricted maximum likelihood (GREML) is a statistical method for variance component estimation in genetics which quantifies the total narrow-sense (additive) contribution to a trait's heritability of a particular subset of genetic variants (typically limited to SNPs with MAF >1%, hence terms such as "chip heritability"/"SNP heritability").

Complex systems is chiefly concerned with the behaviors and properties of systems. A system, broadly defined, is a set of entities that, through their interactions, relationships, or dependencies, form a unified whole.

1. Introduction. Complex Network Analysis (CNA) is a relatively young field of research. The first systematic studies appeared in the late 1990s , , , having the goal of studying the properties of large networks that behave as complex systems. The research owes a great deal of its foundations to the seminal work on Random Graphs of Erdős and Renyi , who studied asymptotic properties of ...

2 Using variation in point estimates to model uncertainty The literature on the Drake equation contains dozens of point-estimate based calculations for N (the number of detectable civilizations in our galaxy).<sup>2</sup> These estimates span 11 orders of magnitude: from  $3 \times 10^4$  to  $1 \times 10^8$ . While each
