The periodic table, or periodic table of elements, is a tabular arrangement of the chemical elements, ordered by their atomic number, electron configuration, and recurring chemical properties, whose structure shows periodic trends. Generally, within one row (period) the elements are metals to the left, and non-metals to the right, with the elements having similar chemical behaviours placed in ...

Using the periodic table, you can classify the elements in many ways. One useful way is by metals, nonmetals, and metalloids. (See also The Periodic Table: Families and Periods.) Most of the elements on the periodic table are classified as metals.

The Periodic Table: Metals, Nonmetals, and Metalloids

A group in the Periodic Table is any column of elements with common properties denoted by the electrons in the outermost layer. There are eight groups of elements in total: Group 1: the alkali metals are the most reactive elements, when mixed with water they form acids. Elements include: Hydrogen (H) and Lithium (Li) Group 2: the alkaline earth metals

Here's the first periodic table with 118 names and elements. The IUPAC has formally approved the element names and symbols for elements 113, 115, 117, and 118. If those change, we'll fix the table. The approved names and symbols for these elements are nihonium (Nh, element 113), moscovium (Mc, element 115), tennessine (Ts, element 117), and oganesson (Og, element 118).

Keep in mind that electronegativities are approximate measures of the relative tendencies of these elements to attract electrons to themselves in a chemical bond. The greater an atom's electronegativity, the greater its ability to attract electrons to itself.
